Better Metering & Monitoring is Growing

Published: August 15, 2025.

Northmore Gordon and SEEITEK announced a new Energy Intelligence Partner Alliance combining our specialist energy and carbon management expertise with SEEITEK's advanced wireless metering and monitoring technology. This partnership delivers rapid, cost-effective metering and monitoring solutions for commercial and industrial (C&I;) businesses across Australia and the APAC region. The alliance enables non-intrusive wireless deployment, granular real-time data collection, AI-powered analytics with custom reporting, and expert strategic guidance - allowing clients to access accurate energy data faster and more affordably than traditional installation approaches.

Northmore Gordon and SEEITEK Partner to Deliver Rapid, Cost-Effective Metering & Monitoring Solutions for C&I; Businesses

Do more with less uncertainty.

We're pleased to announce a new Energy Intelligence Partner Alliance between Northmore Gordon and SEEITEK, combining our specialist energy and carbon management expertise with SEEITEK's advanced wireless metering and monitoring technology.

This partnership is designed to help commercial and industrial (C&I;) businesses across Australia and the APAC region gain faster, more cost-effective access to accurate energy data - the essential foundation for smarter decisions, reduced costs, and improved sustainability performance.

Why the Demand for Better Metering & Monitoring is Growing

Energy and sustainability teams are under pressure to:

- See the whole picture - visualise energy use across equipment, sites, and portfolios in real time.
- Eliminate waste quickly - improve efficiency with limited time, staff, and budget.
- Stay compliant - keep pace with tightening rules, including ASRS reporting mandates.
- Report with confidence - provide accurate, up-to-the-minute data to boards and regulators.
- Scale fast - deploy solutions across multiple buildings or regions without long delays or complex installations.

Without accurate, granular data, even the best-intentioned energy and carbon strategies risk missing opportunities or falling short of compliance.

The Power of the Northmore Gordon-SEEITEK Alliance

By combining SEEITEK's wireless metering and monitoring technology with our strategic energy and carbon advisory expertise, we deliver:

- Rapid, non-intrusive deployment - avoiding costly and disruptive installation works.
- Granular, real-time data - unlocking the detail needed for accurate audits, feasibility studies, electrification planning, carbon reporting, and demand response.
- AI-powered analytics & custom reporting - tailored dashboards and alerts for decision-makers.
- Third-party data integration - connecting with your existing platforms for a single source of truth.
- Expert design & strategic guidance - from metering plans to system optimisation.
- Scalable solutions - manage multiple buildings or complex portfolios from a single platform.
- Cost Effective - Northmore Gordon partnered with SEEITEK as a recognised cost-effective and rapidly deployed metering and monitoring solutions.

Strategic Benefits for C&I; Clients

This isn't just about adding another technology layer. For C&I; operators, it means:

- Lower operational costs - identify and address inefficiencies in days, not months.
- Improved compliance outcomes - accurate data supports NGERS, ASRS, and other regulatory requirements.
- Better project ROI - detailed monitoring enables smarter investment decisions and improved business cases for capital projects.
- Future-proofed sustainability - scalable systems that adapt to growing reporting and decarbonisation demands.

A "Do More with Less" Advantage

In line with our approach to business, this alliance helps clients:

- Do more with less downtime - wireless installation means faster deployment and minimal disruption.
- Do more with less complexity - one integrated platform, one clear data set.
- Do more with less waste - precise insights to cut unnecessary consumption and emissions.
- Do more with less risk - high-quality data reduces compliance errors and missed opportunities for certificates or incentives.

Next Steps For organisations aiming to stay competitive while meeting rising regulatory and stakeholder expectations, accurate, real-time energy data is no longer optional - it's essential.

Northmore Gordon and SEEITEK are ready to help you:

- Map a tailored metering and monitoring strategy.
- Deploy rapidly across one or multiple sites.
- Turn data into actionable, cost-saving strategies.

What is the Energy Intelligence Partner Alliance between Northmore Gordon and SEEITEK?

Northmore Gordon and SEEITEK announced a new Energy Intelligence Partner Alliance combining our specialist energy and carbon management expertise with SEEITEK's advanced wireless metering and monitoring technology. This partnership delivers rapid, cost-effective metering and monitoring solutions for commercial and industrial (C&I;) businesses across Australia and the APAC region. The alliance enables non-intrusive wireless deployment, granular real-time data collection, AI-powered analytics with custom reporting, and expert strategic guidance—allowing clients to access accurate energy data faster and more affordably than traditional installation approaches.

Why are C&I; businesses increasingly demanding better metering and monitoring solutions?

Energy and sustainability teams face mounting pressure to see comprehensive energy use across equipment, sites, and portfolios in real time; eliminate waste quickly despite constrained time, staff, and budgets; stay compliant with tightening regulations such as Australia's mandatory Australian Sustainability Reporting Standards (ASRS); report with confidence to boards and regulators; and scale solutions rapidly across multiple buildings or regions. Better metering and monitoring directly addresses these demands by providing the data infrastructure and insights needed to meet reporting obligations, identify inefficiencies, and support decarbonisation strategies without overwhelming existing resources.

How does wireless metering technology improve deployment compared to traditional metering installations?

SEEITEK's wireless metering technology enables rapid, non-intrusive deployment that avoids costly and disruptive installation works typically associated with hardwired metering systems. This faster deployment allows C&I; businesses to begin collecting granular, real-time energy data for audits, feasibility studies, electrification planning, and carbon reporting much sooner. The reduced installation complexity and downtime mean organisations can start identifying inefficiencies and cost-saving opportunities in days rather than months, while minimising disruption to normal operations—a critical advantage for busy facilities with limited tolerance for construction or system interruptions.

What operational and compliance benefits does improved metering and monitoring provide?

Better metering and monitoring delivers lower operational costs by identifying and addressing inefficiencies rapidly, improved compliance outcomes supporting NGERs, ASRS, and other regulatory requirements, and better project return on investment through detailed monitoring that supports smarter investment decisions and stronger capital project business cases. Real-time, granular data enables organisations to demonstrate energy performance and emissions reductions credibly, reducing compliance errors and helping identify missed opportunities for environmental certificates or incentives. For water utilities and industrial facilities, precise consumption tracking also supports energy management system implementation and ongoing performance verification—essential for meeting mandatory energy-management obligations and sustainability reporting deadlines.

How does the SEEITEK and Northmore Gordon alliance support Australian Sustainability Reporting Standards (ASRS) compliance?

The alliance helps organisations meet ASRS—Australia's mandatory climate-related financial reporting standards that began on 1 January 2025—by providing the data infrastructure and expert guidance needed to collect, verify, and report emissions information with confidence. Rapid metering deployment enables organisations to establish reliable baseline data and track actual performance against forecasts. Our carbon advisory services, combined with SEEITEK's real-time monitoring, allow businesses to document emissions inventories and transition pathways accurately. This integrated approach reduces compliance risk and ensures organisations have the evidence needed to satisfy regulatory reporting requirements and board-level accountability.

What does 'do more with less' mean in the context of this metering and monitoring partnership?

The partnership helps clients achieve more with less downtime through wireless installation enabling faster, non-disruptive deployment; less complexity via one integrated platform and single unified dataset; less waste by providing precise insights to cut unnecessary energy consumption and emissions; and less risk through high-quality data that reduces compliance errors and identifies missed opportunities for certificates or financial incentives. This framework reflects the operational reality that C&I businesses operate under tight resource and time constraints. By combining wireless technology with expert advisory services, the alliance allows teams to implement effective metering and monitoring systems without the traditional burden of complex installations, data management fragmentation, or prolonged project timelines.

How can Northmore Gordon help organisations develop and implement a metering and monitoring strategy?

We can work with organisations and SEEITEK to map a tailored metering and monitoring strategy aligned with their specific business decision and energy management objectives. As described in our delivery approach, we help clients define what information they need to collect, establish data responsibilities and quality standards, and design measurement systems that answer operational or investment questions. We then support rapid deployment across one or multiple sites and help turn collected data into actionable, cost-saving strategies through analysis, benchmarking, feasibility studies, and integration with energy management systems. This comprehensive support ensures the metering investment delivers measurable operational and financial benefits.

What role does real-time energy data play in identifying cost-saving opportunities and supporting investment decisions?

Real-time, granular energy data enables organisations to identify inefficiencies and cost-saving opportunities in days rather than months, supporting faster decision-making on capital investments. Detailed monitoring provides the evidence needed to build credible investment cases by showing baseline performance, quantifying savings potential, and supporting measurement and verification of implemented projects. For electrification, renewable heat, or equipment-replacement decisions, precise data on current consumption patterns, peak loads, and system interactions allows Northmore Gordon to conduct accurate feasibility assessments and rank opportunities by financial and operational merit. This data-driven approach reduces investment risk and improves project ROI by ensuring capital is directed toward improvements with the strongest business case and clearest pathway to verified savings.

How does the alliance address scalability for organisations managing multiple sites or complex portfolios?

The partnership delivers scalable solutions enabling organisations to manage multiple buildings or complex portfolios from a single integrated platform. SEEITEK's wireless technology allows rapid, cost-effective expansion across additional sites without the installation complexity and expense of traditional hardwired metering. Our multi-site energy management expertise, combined with moreData portfolio-planning capabilities, enables organisations to establish consistent data collection, performance tracking, and reporting across geographically dispersed or operationally diverse sites.

This scalability is particularly valuable for large water utilities, regional facility operators, and industrial businesses with multiple production locations—allowing them to identify material energy-use patterns, prioritise improvement opportunities across the portfolio, and implement coordinated energy management systems efficiently.

Why is early metering planning important for energy efficiency projects and certificate schemes?

Early metering planning is critical because measurement and verification requirements, evidence timelines, and regulatory eligibility criteria must be established before equipment installation or significant project commitments. We recommend defining the measurement boundary, baseline period, data quality standard, and responsibilities before work begins—decisions that cannot be recovered after installation. For certificate schemes such as Victorian Energy Upgrades or NSW ESS, choosing the correct M&V method early identifies what pre- and post-project evidence must be collected. Wireless metering technology accelerates this planning by enabling rapid baseline data collection even before formal project approval. This approach preserves funding and certificate eligibility options, ensures compliance with scheme timing rules, and provides the high-quality evidence needed to verify savings and support investment case credibility.
