Why We're Investing in Energy Efficiency Sector

Wind ... apparently it makes you annoyed

What topics does Northmore Gordon's News page cover, and why are they relevant to energy and carbon management?

The News page features updates on energy markets, renewable energy, solar installations, government legislation, and energy infrastructure. These topics are relevant because energy projects depend on understanding current policy, certificate market conditions, and regulatory changes. We publish compliance updates, market analyses, and funding announcements to help clients track eligibility deadlines, investment opportunities, and scheme rule changes. Regular market updates on Australian certificates help stakeholders monitor pricing and liquidity for energy-efficiency and renewable-energy projects. Understanding government programs and policy shifts supports project timing and funding-pathway decisions.

How frequently does Northmore Gordon publish compliance updates, and what information do they typically contain?

We publish monthly compliance updates, with documented editions for May, June, July, August and September 2026. These updates provide guidance on regulatory obligations, scheme rule changes, and reporting deadlines relevant to energy and carbon projects. Compliance updates help businesses track application periods, evidence requirements, and eligibility thresholds across multiple schemes. They serve as a practical reference for understanding changes to programs like the NSW Energy Savings Scheme, Victorian Energy Upgrades, and ACCU regulations. Subscribing to these updates

helps project managers and sustainability teams maintain current awareness of deadlines and policy shifts affecting project economics and timing.

What are Australian Certificate Markets updates, and how can they inform investment decisions?

Australian Certificate Markets updates provide periodic analysis of renewable energy and energy-efficiency certificate pricing and trading activity. These reports, published monthly, track price movements, market volume, and demand signals across schemes including LGCs, STCs, REGOs, ESCs, and ACCUs. Understanding certificate market conditions is essential for project investment cases because certificate revenue depends on both eligibility and sale price. We publish these updates to help clients assess financial viability, timing sensitivity, and funding-pathway options. The updates support comparisons between different incentive schemes and inform procurement and retirement strategies for renewable electricity attributes and carbon credits.

How can users access live certificate price information through Northmore Gordon's site?

The News page includes a link to '/certificate-prices/' where users can check live Australian certificate prices. This resource provides real-time pricing data for environmental certificates including renewable-energy and energy-efficiency instruments. Live prices support investment-case preparation by allowing project teams to build scenarios based on current market conditions rather than historical averages. Price transparency also helps with timing decisions: projects with certificate revenue can assess whether current market conditions support proceeding or whether waiting for price recovery might be more advantageous. Our price tracking supports our broader advisory on certificate schemes and funding-pathway assessment.

What role do government funding announcements play in Northmore Gordon's News coverage?

We publish news about government grants and renewable-energy funding programs, such as the '\$100 million renewable energy program to fast-track grid-ready solar and battery projects' announced in August 2026. These announcements are significant because eligible projects can access upfront capital support that reduces customer payback and improves investment case economics. News coverage helps stakeholders discover new funding rounds, understand eligible project types, and assess application timing and conditions. We combine funding news with our capacity-assessment and project-brief services to help clients evaluate program alignment, prepare applications, and understand how grants interact with other support mechanisms like certificates and financing.

Does Northmore Gordon cover international energy policy, and how does that inform Australian clients?

Yes, we publish international energy policy updates, including a Korea Renewable Energy Policy Update from June 2026. This coverage helps Australian clients understand global policy trends, emerging technologies, and international investment signals that may influence Australian regulatory development and market opportunities. International policy analysis provides context for long-term strategy and helps multinational organizations align Australian operations with global sustainability commitments. Understanding policy evolution in comparable markets supports transition planning and technology selection decisions. Our international coverage complements its core Australia and Singapore operating focus by providing strategic market intelligence for clients with global sustainability ambitions.

How should businesses use Northmore Gordon's News content alongside its core consulting services?

News content provides ongoing market context and regulatory awareness that supports our energy-optimization, carbon-advisory, and certificate-assessment services. Compliance updates alert clients to scheme rule changes that affect project eligibility, measurement requirements, or timing decisions. Certificate market reports inform funding-pathway assessment and investment-case

assumptions. Government funding announcements identify new grant opportunities to evaluate within grants, certificates, and finance comparisons. Clients can combine News subscriptions with our capability for project brief preparation, measurement and verification planning, and scheme-specific assessments to ensure their projects reflect current policy, market conditions, and available support mechanisms.

What types of energy infrastructure developments does Northmore Gordon report on?

Our News coverage includes renewable energy, solar infrastructure, energy markets, and grid developments relevant to project economics and eligibility. Infrastructure news includes announcements about grid-ready renewable projects, battery systems, and distribution network changes. These developments are relevant because energy-infrastructure capacity and network conditions affect feasibility of renewable installations, electrification pathways, and on-site generation viability. Understanding network upgrades and grid connection trends helps project teams plan timing and assess technical feasibility. Infrastructure reporting provides context for renewable-heat options, process electrification studies, and transitions from gas to electric systems that we evaluate through our energy-optimization and carbon-transition services.
