What is the purpose of Northmore Gordon's Newsletters archive page?

The Newsletters archive at northmoregordon.com/newsletters/ provides a historical record of our past communications, with each entry showing a publication date and link to the full content. This archive allows stakeholders to review our previous updates on energy, carbon management and environmental certificate topics. Accessing past newsletters can help organisations understand how our service offerings, industry schemes and technical guidance have evolved over time, and may provide context for current energy-project decisions or regulatory changes affecting their operations.

What topics have Northmore Gordon's archived newsletters addressed?

The archived newsletters span multiple years and cover regulatory and commercial developments relevant to energy efficiency and environmental certificates. Notable examples include VEET (Victorian Energy Efficiency Target) schedule updates and government consultation processes, reflecting our focus on scheme eligibility and policy changes. The newsletters provide historical perspective on how Victorian Energy Upgrades, energy-savings schemes and related incentive programmes have developed. Organisations reviewing past newsletters can identify how scheme rules, discount factors and certificate methodologies have changed, informing decisions about current and future energy projects across different regulatory jurisdictions.

How can archived newsletters help with energy-project planning?

Past newsletters document regulatory changes, scheme updates and technical guidance that shaped previous energy-project decisions. By reviewing archived content, organisations can understand how eligibility rules, certificate calculations and funding pathways have evolved. This historical context is particularly valuable when comparing outcomes from earlier projects with current opportunities, or when

assessing whether a previous investment case remains valid under updated scheme rules. Organisations should use newsletters as background material to inform current decision-making, then verify all eligibility and commercial terms against current scheme documentation before relying on any historical information for new projects.

Why would an organisation review Northmore Gordon's newsletters when planning energy improvements?

Newsletters provide accessible summaries of policy developments, scheme changes and technical updates that affect energy-project economics and eligibility. An organisation planning an upgrade in a regulated scheme—such as Victorian Energy Upgrades or NSW Energy Savings Scheme—can use past newsletters to understand how the scheme has changed over time and what eligibility criteria or calculation methodologies may have been updated. This background helps frame a current project brief with appropriate historical context. However, newsletters should not replace verification of current scheme rules, and any project relying on specific eligibility pathways must be assessed against the current applicable documentation and deadlines.

What should organisations do with information from historical newsletters when starting a new energy project?

Historical newsletters provide useful background on how schemes and regulations have evolved, but should not be treated as current guidance for new projects. When starting an energy assessment, use the newsletter archive to understand past context and our service approach, then prepare a current project brief with the latest scheme documentation, energy data and operating constraints. We can assist by confirming which current pathways apply to a new proposal, verifying eligibility under current rules and identifying what evidence must be gathered before making investment or procurement decisions. Always distinguish archived information from current scheme requirements before committing to project timelines or financial assumptions.

How do Northmore Gordon's newsletters relate to the company's broader knowledge library?

The newsletter archive complements our Knowledge Library, which provides current, structured guidance on energy assessment, schemes and technical systems. Newsletters typically address timely developments and policy updates, while the Knowledge Library documents foundational concepts and decision frameworks. An organisation beginning an energy project may first browse newsletters to understand recent regulatory changes, then consult the Knowledge Library for detailed guidance on energy audits, investment cases, measurement and verification, and scheme-specific pathways. Together, the resources provide both historical context and current decision-support tools for energy efficiency and carbon management initiatives.

What types of regulatory or commercial developments have Northmore Gordon's newsletters addressed?

Archived newsletters document scheme updates, policy consultations and technical guidance changes affecting energy-project eligibility and incentives. Examples include VEET schedule-factor updates and government gazette announcements that influence certificate calculations and project economics. Newsletters have tracked how discount factors and eligibility criteria for schemes like Victorian Energy Upgrades evolve over time. By reviewing newsletters alongside current scheme documentation, organisations can understand whether key commercial assumptions in an older project remain valid, or whether new pathways have emerged. This is particularly important for organisations considering multi-year programmes or comparing the merits of similar technologies across different time periods.

Should an organisation rely solely on archived newsletters for energy-project decisions?

No. Archived newsletters provide valuable historical context and illustrate our service approach, but should not be the sole basis for energy-project decisions. Newsletter content may reference scheme

rules, eligibility criteria or commercial terms that have since changed. Any project relying on specific incentive pathways, certificate eligibility or funding arrangements must verify current requirements against the governing scheme documentation, applicable government guidance and current commercial terms. We can assist by reviewing a project brief against current rules and helping organisations distinguish historical context from current requirements, ensuring investment decisions rest on verified, up-to-date eligibility and regulatory information.
